## Features

- Supports DOCSIS 3.0/1 requirements
- Exceptional harmonics performance
- 2fo of $-117 \mathrm{dBc} @ 170 \mathrm{MHz}$
- 3fo of $-134 \mathrm{dBc} @ 170 \mathrm{MHz}$
- Best in class linearity across frequency band
- Low insertion loss and high isolation performance
- Insertion loss of $0.3 \mathrm{~dB} @ 1218 \mathrm{MHz}$
- Isolation of $50 \mathrm{~dB} @ 204 \mathrm{MHz}$
- High ESD performance of 1.5 kV HBM
- Packaging - 32-lead $5 \times 5 \mathrm{~mm}$ QFN

## Applications

- Broadband market (DOCSIS 3.0/1)
- Cable modem
- Set-top box
- Filter bank switching
- Relay replacement to switch between DOCSIS 3.0 and DOCSIS 3.1 configurations Peregrine

## Product Description

The PE42722 is a HaRP™ technology-enhanced reflective SPDT RF switch designed for use in cable applications including DOCSIS 3.0/1 cable modem and set-top box. It delivers high linearity and excellent harmonics performance in the $5-1794 \mathrm{MHz}$ band. It also features low insertion loss and high isolation performance that makes the PE42722 ideal for DOCSIS 3.1 applications.
The PE42722 is manufactured on Peregrine's UltraCMOS ${ }^{\circledR}$ process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

## Absolute Maximum Ratings

Exceeding absolute maximum ratings listed in Table 1 may cause permanent damage. Operation should be restricted to the limits in Table 2. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

## ESD Precautions

When handling this UltraCMOS device, observe the same precautions as with any other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified in Table 1.

## Latch-up Immunity

Unlike conventional CMOS devices, UltraCMOS devices are immune to latch-up.

## Switching Frequency

The PE42722 has a maximum 25 kHz switching rate. Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reached $50 \%$ of the final value and the point the output signal reaches within $10 \%$ or $90 \%$ of its target value.

## Spurious Performance

The typical spurious performance of the PE42722 is -137 dBm .

## Thermal Data

Psi-JT ( $\Psi_{J T}$ ), junction top-of-package, is a thermal metric to estimate junction temperature of a device on the customer application PCB (JEDEC JESD51-2).
$\Psi_{J T}=\left(T_{J}-T_{T}\right) / P$
where
$\Psi_{\mathrm{JT}}=$ junction-to-top of package characterization parameter, ${ }^{\circ} \mathrm{C} / \mathrm{W}$
$\mathrm{T}_{\mathrm{J}}=$ die junction temperature, ${ }^{\circ} \mathrm{C}$
$\mathrm{T}_{\mathrm{T}}=$ package temperature (top surface, in the center), ${ }^{\circ} \mathrm{C}$
P = power dissipated by device, Watts

## Evaluation Kit

The PE42722 evaluation board was designed to ease customer evaluation of the PE42722 RF switch. The RF common port is connected through a $75 \Omega$ transmission line via the F-Type connector, J1. RF1 and RF2 ports are connected through $75 \Omega$ transmission lines via F-Type connectors J2 and J3, respectively. A $75 \Omega$ through transmission line is available via F-Type connectors J5 (THRU left) and J6 (THRU right), which can be used to deembed the loss of the PCB. DC power is supplied through J10, with $\mathrm{V}_{\mathrm{DD}}$ on pin 9 , and GND on the entire lower row of even numbered pins. To evaluate a switch path, add or remove jumpers on V1 (pin 3) using Table 5.

Series 6.2 nH inductors are used on the three RF ports to provide impedance matching.
